Most draws of t land where there is little to learn
direct regression on (z0, z_prev): 26.9% (input the model never sees)
direct regression on z0 only = f(t = 0): 15.2%
uniform-t average 𝔗 = 5.5% (2.76× below f(0))
fraction of ‖z1 − z0‖² explained (%)
interpolation time t
optimal linear E[δ | z_t], held-out entries
Gaussian reversible closed form, ρ = 0.70 from f(0) alone
